Please reject NAB petition 04-160. XM Satellite Radio provides a valuable service with its broadcasts of Instant Traffic & Weather in that the satellite broadcasts are frequently updated and are available under certain circumstances when conventional radio is not (weather conditions, or incomplete and/or not current information). Satellite radio in general is a great alternative to conventional radio when travelling long distances because you don't have to keep readjusting your stations as you change geographic areas. It is also less frustrating. In some areas of the country, the only conventional radio stations available may not play the type of music one prefers; or all the locally available stations play the same genre. With satellite radio, I can listen to classical music in the Shenandoah Valley or Miami, FL. I often cannot get classical music in these areas using conventional radio. Please do not take away our freedom of choice!
